

CLAIMS

1. A method for managing information between communicating objects,
5 said information originating from information provider communicating objects
and having to be consulted from communicating objects able to deliver
information, according to which:

- data comprising an item of information to be disseminated provided
by an information provider communicating object and a parameter indicating an
10 identification of a location associated with said item of information are acquired
and are stored, the location belonging to a set of locations identified in a unique
manner in a system of reference ;

- at least one stored item of information associated with said location is
delivered by way of at least one communicating object able to deliver
15 information and situated at said location.

2. The method as claimed in claim 1, according to which said
communicating object able to deliver information comprises an information
delivery device fixed at a location and affording access to stored information
20 associated with said location.

3. The method as claimed in any one of the preceding claims,
according to which a stored item of information associated with a location is
delivered by way of a communicating object able to deliver information and
25 providing the parameter indicating the identification of said location.

4. The method as claimed in any one of the preceding claims,
according to which a location in which a communicating object able to deliver
information is situated is determined, and stored information associated with
30 said location is delivered by way of said communicating object.

5. The method as claimed in any one of the preceding claims,
according to which a location in which an object providing information is

situated is determined, and at least one datum comprising an item of information provided by way of said object providing information and a parameter indicating the identification of said location are acquired and are stored.

5

6. The method as claimed in any one of the preceding claims, according to which a step of identification of a user of a communicating object able to deliver information is carried out, and the user is afforded access to stored information associated with a location by way of said communicating
10 object as a function of at least the results of this step of identification.

7. The method as claimed in claim 6, according to which furthermore a step of authentication of the user is carried out, and access to associated stored information is a function of at least the results of this step of
15 authentication.

8. The method as claimed in any one of the preceding claims, according to which said information provider communicating object associated with a location comprises an information acquisition device fixed to said
20 location.

9. The method as claimed in any one of the preceding claims, according to which at least one step of identification of a user of an information provider communicating object is carried out, and at least one datum
25 comprising an item of information provided by the user by way of said object is acquired and stored as a function of at least the results of this step of identification.

10. The method as claimed in claim 9, according to which furthermore
30 a step of authentication of the user is carried out, and the acquisition and the

storage of the datum is a function of at least the results of this step of authentication.

11. The method as claimed in any one of the preceding claims,
5 according to which, when a communicating object is located for the first time in a location, an operation destined for said communicating object is triggered, prompting it to provide an item of information when the communicating object is an information provider, and to have access to stored information associated with said location when the communicating object is able to deliver information.

10

12. A system for managing information between communicating objects by way of a location, said information originating from information provider communicating objects and having to be consulted from communicating objects able to deliver information, said system comprising means for implementing a
15 method as claimed in any one of the preceding claims.

13. A platform for managing information comprising at least two information management systems according to claim 12, and comprising means specifically for matching up the location identification in the system of
20 reference of one of the two information management systems with the location identification in the system of reference of the other of the two information management systems.
